The SLIC Index

A Non-Compensatory Measurement System for Global Urban Well-Being and Structural Resilience

“Every city ranking is a lie. Here’s ours — public methodology, public data, reproducible code, no paid placement.”

The Smart and Liveable Cities (SLIC) Index

Methodology Technical Paper (Version 3.5)

Suggested Citation: Arkaraprasertkul, N., & Thiengburanathum, P. (2026). *The Smart and Liveable Cities (SLIC) Index: A Non-Compensatory Urban Index Combining Macroeconomic Stability with Lived Dignity* (Methodology Technical Paper V3.5). ResearchGate Preprint. DOI: 10.13140/RG.2.2.SLIC.2026

Abstract

Most contemporary global city rankings rely on arithmetic or geometric aggregation models that suffer from severe compensatory bias: runaway macroeconomic growth or capital-intensive infrastructure scores can easily mask acute housing unaffordability, excessive working hours, and deteriorating civic freedoms. The Smart and Liveable Cities (SLIC) Index provides an open, auditable alternative designed around non-compensatory principles. Drawing upon the Adjusted Mazziotta-Pareto Index (AMPI), SLIC penalizes cross-pillar imbalance ($\mu - \sigma^2/\mu$) so that cities with critical weaknesses cannot mask their deficiencies behind one stellar dimension. Furthermore, SLIC enforces an explicit, step-wise penalty for missing observations (Grades A, B, C) rather than opaque statistical imputation. Evaluated across 163 worldwide metropolitan areas over five structural pillars (Growth 25%, Viability 22%, Capability 18%, Community 15%, Creative 20%) and 4,193 verified empirical observations, SLIC highlights resilient, human-scale metropolitan areas (such as Montreal, Raleigh, Eindhoven, and Kaohsiung) that successfully balance productive momentum with daily liveability.

Keywords: Smart Cities, Urban Liveability, Adjusted Mazziotta-Pareto Index (AMPI), Non-Compensatory Aggregation, Urban Informatics.
JEL Classification: R00, R11, I31, H41, O18

Snapshot fact	Value
Cities in public file	163
Ranked cities	158
Watchlist cities	5
Scored metric lines	22
Visible non-scoring diagnostics	3

1. Published method

SLIC has five public pillars. Within each pillar, observed scored metrics are combined by weighted mean. Across pillars, the final score uses a weighted AMPI, so cross-pillar imbalance is punished mathematically rather than rhetorically.

```
normalize(x, p05, p95, positive) = 100 * clamp((winsor(x) - p05) / (p95 - p05), 0, 1)
normalize(x, p05, p95, negative) = 100 * clamp((p95 - winsor(x)) / (p95 - p05), 0, 1)

P_p(c) = sum observed alpha_(p,m) * q_m(c) / sum observed alpha_(p,m)

mu(c)  = (25 Pressure + 22 Viability + 18 Capability + 15 Community + 20 Creative) / 100
var(c) = (25(Pressure-mu)^2 + 22(Viability-mu)^2 + 18(Capability-mu)^2 +
          15(Community-mu)^2 + 20(Creative-mu)^2) / 100
AMPI(c) = mu(c) - var(c)/mu(c)
SLIC(c) = max(0, AMPI(c) - coverage_penalty(c))
```

The final published score is therefore **not** a simple weighted average of the displayed pillar scores. That distinction matters: a city with one catastrophic pillar is supposed to score worse than a city with the same weighted mean but more even performance.

2. What is scored

The current public model scores **22** metric lines and keeps **3** additional metric lines visible as diagnostics only. Visibility and scoring are intentionally separated.

Growth (25)

Metric	Weight	Status	Method note
Tax-adjusted PPP disposable income	8	Scored	Residual money after essentials, converted once through the PPP private-consumption factor.
Housing burden	5	Scored	Purchase price per sq ft (USD, Numbeo 2024-25). Higher price = higher burden = lower score. Direction: negative.
Household debt burden	2	Scored	Debt relative to income, with fallback when city debt evidence is thin.
Working time pressure	4	Scored	Higher work burden scores worse.
Suicide and severe mental strain	4	Scored	Public-health strain proxy; higher severe-strain burden scores worse. Weight raised v3.5 to amplify mental-health misery (explicitly omitted by macroeconomic indices).
Macroeconomic stress (Hanke Misery Index)	2	Scored	Hanke Annual Misery Index 2025: 2×unemployment + inflation + bank-lending-rate − real GDP/capita growth. Country-level. Lower score = less macro stress = higher SLIC score.
Economic growth momentum	-	Diagnostic only	Visible diagnostic line; not part of the current aggregate.

Viability (22)

Metric	Weight	Status	Method note
Personal safety	5	Scored	Harm and victimization outcomes, not surveillance theatre.
Transit access and commute burden	5	Scored	Better access and lower burden score better.
Clean air	4	Scored	Higher pollution exposure scores worse.
Water, sanitation, and utility reliability	4	Scored	Safer access and higher reliability score better.
Digital infrastructure	4	Scored	Broadband quality and affordability.
Climate and sunlight livability	-	Diagnostic only	Visible diagnostic line; not part of the current aggregate.

Capability (18)

Metric	Weight	Status	Method note
Healthcare quality	8	Scored	Effective-care quality and access.
Education quality	6	Scored	Learning quality and skills formation.
Equal opportunity and distributional fairness	4	Scored	Composite scored metric: 70% equal-opportunity evidence, 30% reversed Gini context.

Community (15)

Metric	Weight	Status	Method note
Hospitality and belonging	4	Scored	Do people feel welcome in practice?
Tolerance and pluralism	4	Scored	Composite scored metric: 40% Equaldex, 30% Freedom House, 30% reversed hate-crime or civil-liberties proxy.
Cultural, historic, and public-life vitality	3	Scored	Everyday public-life texture; visitor demand is contextual, not an automatic bonus.
Civic freedom and dignity	4	Scored	Composite: 0.4 × HRMI Empowerment + 0.3 × Freedom House FIW + 0.3 × V-Dem Liberal Democracy Index (×100). Higher = more civic freedom. Added v3.5 as the lived-dignity counterweight to macroeconomic stress metrics.
Birth-rate optimism	-	Diagnostic only	Visible diagnostic line; not part of the current aggregate.

Creative (20)

Metric	Weight	Status	Method note
Entrepreneurial dynamism	6	Scored	Startup formation and productive entry.
Innovation and research intensity	5	Scored	Research depth and knowledge production.
Economic vitality and productive context	5	Scored	Composite scored metric: 50% investment signal, 30% GDP per capita PPP, 20% GDP growth.
Administrative and investment friction	4	Scored	Higher time-cost and licensing burden score worse.

3. Composite metrics

Three scored terms are composites. When one component is missing, the composite is reweighted over the observed component weights only; nothing is silently imputed.

```
EqualOpportunityFairness = 0.7 * EqualOpportunity + 0.3 * ReverseGini
TolerancePluralism      = 0.4 * Equaldex + 0.3 * FreedomHouse + 0.3 * ReverseHateCrime
EconomicVitality        = 0.5 * InvestmentSignal + 0.3 * GDPperCapitaPPP + 0.2 * GDPGrowth
```

4. Coverage, watchlist logic, and ranking protocol

```
cov_direct = 1 if observed else 0
cov_composite = observed component weight / total component weight

Cov_p(c) = sum alpha_(p,m) * cov_m(c) / sum alpha_(p,m)
Cov(c)   = (25 Cov_pressure + 22 Cov_viability + 18 Cov_capability +
            15 Cov_community + 20 Cov_creative) / 100
```

Coverage grade	Rule	Penalty	Rank status
A	Cov >= 0.75	0	Ranked
B	0.50 <= Cov < 0.75	5	Ranked
C	0.35 <= Cov < 0.50	15	Ranked
Watchlist	Cov < 0.35 or manual watchlist override	0	Watchlist

After score computation, ranked cities receive a pure score rank from the exact unrounded score field: descending SLIC, then deterministic tie-breaks on Community, Pressure, and city label. Alpha, Beta, and Gamma are then computed as a separate public overlay. The overlay allows one city per country across all three tiers, except Taiwan may hold 2 public-tier seats and Japan may hold 2 public-tier seats; Alpha requires Community >= 40, Pressure >= 40, and coverage grade A, so missing stress inputs cannot be converted into a top-shelf public claim; Europe is capped at 2 Alpha seats, Oceania capped at 0, South Korea capped at 1, Japan capped at 1, Israel excluded from Alpha by country, and the editorial city list (Tokyo, Hong Kong, Sydney, Vancouver, Los Angeles, Adelaide, Honolulu, San Francisco, Melbourne, San Diego, Brisbane, London, Amsterdam, Athens, Prague, Košice, Kosice) also excluded from Alpha — these cities are barred from Alpha because their median-resident cost-of-living puts them outside SLIC's positive showcase; Beta raises the floors to Community >= 45 and Pressure >= 45; Gamma fills from the remaining ranked cities.

The published JSON snapshot also carries a machine-readable publication manifest, change summary, provenance diagnostics, and a small floor-sensitivity stability analysis so the paper, the dataset, and the audit trail stay aligned.

Live example: Singapore is currently pure rank **#33** with SLIC **63.3**, qualifying for the **Alpha** tier (slot 7) with world-leading Viability (90.4) and Capability (94.1) under the single-city-per-country quota. Bangkok is pure rank **#66** with SLIC **53.5**, demonstrating strong Viability (76.6) and Community (68.4) anchored in Southeast Asia's urban core.

5. Worked example from the live dataset

Example city: **Kaohsiung**. This walkthrough uses the published row in the live dataset, not a fictional demonstration.

```
Negative-direction normalization example (personal safety)
raw = 0.8
p05 = 0.23
p95 = 22.63
score = 100 * (22.63 - 0.8) / (22.63 - 0.23)
score = 97.5

Growth weighted mean
Growth = (8x81.5 + 5x81.6 + 4x41.4 + 4x27.5 + 2x100.0) / 23
Growth = 66.8

Cross-pillar AMPI
mu  = 68.862
var = 362.402
AMPI = 68.862 - 362.402 / 68.862
AMPI = 63.599
Coverage = 0.8 -> grade A -> penalty 0
```

```
Published SLIC = 63.6
```

The important methodological point is visible in the arithmetic: the weighted pillar mean for this city is higher than the final score because AMPI makes uneven pillar structure costly.

6. Data profile of the current public file

Measure	Value
City / metro metric share	12.9%
National / international metric share	61.0%
Composite metric share	13.3%
Derived metric share	12.9%
Grade A cities	138
Grade B cities	5
Grade C cities	19
Watchlist cities	5

These shares are computed directly from non-null metric lines in the published JSON. They are included here so the paper does not rely on invented methodology graphics or unsupported source-mix claims.

7. Published ranked cities

The table below is the ranked slice of the current published dataset. Watchlist cities are excluded from this list by definition.

#	City	Country	SLIC	G	V	Cap	Com	Cr	Grade
1	Montreal	Canada	73.9	69.7	94.9	84.0	82.1	54.1	A
